

Most files were created at the start of the project, with only 3 additional files needing to be generated around the 50th week of production. Large updates to the project occur to be at week 90, 220, and 300, with regular patches in between each version. Our latest update was around week 300, about 75 weeks after the previous major edit, and 50 weeks after a minor patch. Most file implementations have been smooth, however there are three to four files that consistently undergo updates. I suggest re-examining these files for ease of compatibility with further and future updates. Our heaviest update and patch timeframe was between week 90 and 150. Matthew Rollings and Scott Alexander-Bown make up the majority of the edits on the files. Low impact programmers include Fi5t, Leon.Karabchevsky, and leocadiotine. We should also note the progress of programmers that have not edited the code in the past 100 weeks.
